

CAR DSP INSTALLATION

Requirements & Quote Checklist

CUSTOMER: _____	DATE: _____
VEHICLE: _____	SHOP / ADVISOR: _____

1. What I am asking the shop to build

Goal: A safe, reliable, vehicle-integrated DSP system that the shop can commission professionally and that I can continue tuning, measuring, and documenting afterward.

I am not asking the shop to remove speaker protection or disclose proprietary shop methods. **I do need an untouched, recoverable installer baseline plus full access to editable copies of my own vehicle's configuration.**

2. System and tuning capabilities required

REQUIREMENT	WHAT I NEED
DSP platform	Vehicle-compatible DSP with enough independent outputs for the installed system and practical room for future expansion.
OEM integration	Correct interface, input summing, de-EQ / all-pass correction, load handling, and warning-chime / factory-feature retention as applicable.
Per-output control	Independent gain, mute/solo, polarity, delay, crossover, parametric EQ, and routing for each processed output.
Protection	Installer-set high-pass / low-pass filters, output limits, gain structure, and limiter settings appropriate for the speakers and amplifiers.
Comparison	A safe method to compare presets or bypass selected processing without defeating required protection.
Measurement access	Ability to isolate channels and recall known presets so I can perform repeatable in-car measurements and listening comparisons.

3. Access and handoff required after installation

- Full access to the manufacturer's tuning software required for this installed DSP, including any necessary owner account, license, interface, cable, or wireless connection method.
- Ability to open, edit, save, export, import, and restore configuration files without returning to the shop for routine access.
- One untouched installer baseline file and at least one separate editable working copy.
- A clear input map, output / speaker map, amplifier channel map, and any OEM integration notes needed to understand the signal path.
- Documented safe limits: maximum recommended output level, protected crossover points, limiter settings, and any controls I should not change.
- Permission to build and test my own presets without voiding installation support or warranty, provided I stay within the documented safety limits.

4. Quote must identify

- Exact DSP model and number of usable input / output channels
- OEM integration interface, T-harness, adapters, and retained factory functions
- Amplifiers, speakers, controller / remote, wiring, power distribution, and mounting hardware
- Fabrication, installation labor, initial tuning, measurement, and follow-up tuning
- Software / license / account costs and any owner-access limitations
- Warranty terms, reversibility, tax, and complete installed total

5. Installer confirmation checklist

ITEM	CONFIRM	SHOP RESPONSE / DETAILS
Owner software access	Yes / No	Software: _____ Version: _____
Editable configuration supplied	Yes / No	File format / delivery: _____
Protected baseline supplied	Yes / No	Recovery method: _____
Independent output control	Yes / No	Usable outputs: _____ Expansion outputs: _____
Channel mute / solo available	Yes / No	Notes: _____
Preset or A/B comparison available	Yes / No	Method: _____
Installation substantially reversible	Yes / No	Permanent changes: _____
Owner presets allowed under warranty	Yes / No	Conditions: _____

6. Safety and baseline expectations

- The shop should establish and label a safe master tune before handing over the system.
- Speaker-protection filters, gain structure, and maximum safe operating limits must be explained and documented.
- I need a recovery path if a working tune is corrupted: reload the installer baseline, reconnect, and verify normal operation.
- Any bypass or comparison mode must preserve required speaker protection and safe output levels.
- Please flag any tuning action that can damage hardware, create clipping, defeat OEM safety functions, or cause warranty problems.

7. Measurement and documentation use

I intend to use the finished system for personal automotive-audio engineering development. That may include repeatable measurements, controlled preset comparisons, listening evaluations, response plots, delay / imaging work, and written project documentation. I may photograph and document my own vehicle and equipment. I will not publish confidential shop information or proprietary tuning methods without permission.

8. Items to resolve before I authorize the installation

- A locked or shop-only tune that I cannot open, save, or restore
- No owner copy of the configuration or no protected installer baseline
- No documented signal-flow / channel map or safe adjustment limits
- A warranty that is voided merely by creating owner presets within agreed limits
- An incomplete quote that omits required integration hardware, software access, follow-up, or likely fabrication
- Permanent vehicle modification that has not been disclosed and approved

9. Shop recommendation and notes

Recommended system / DSP: _____

Why this platform fits the vehicle and goals:

Recommended installation stages, if phased:

Expected installed total and scheduling:

Follow-up tuning / support arrangement:

Decision condition: I plan to proceed only after receiving an itemized quote, confirming the access and safety conditions above, and determining that the total investment is financially reasonable for both long-term vehicle use and portfolio development.
